Enea Builds E-trade Solutions to KG Knutsson

Enea Business Software AB builds e-trade platforms to KG Knutsson AB (KGK), whose customers get support in the sense of an individual adaptable e-trade solution place, with access to a vehicle card index. The technical solution is based upon system components from Enea.

KGK develops a powerful e-trade platform for their customers. The platform offers a possibility to adjustable Web Networks in order to sell KGK's assortment to customers. The system gives also total access to a vehicle card index in order to give faster and more secure choice of components than current system.

As a supplier of e-trade platforms, KGK has chosen Enea Business Software. The final solution will be brought onto the market during the six first months of the year 2002.

– KGK has chosen Enea as supplier, since, Enea is in a superior class and can offer us the shortest time to get it running. The reason why Enea can shorten the manufacture time is due to the fact that Enea can use several ready made system modules, says the Project leader at KGK.

 – We have long experience of developing e-trade solutions for industries and trade markets. KGK's application is totally in alignment with our technical competence and in our market direction, says Juha Juslin, President at Enea Business Software.

The technical solutions are based, in the first place, on fundamental configurations, by Enea's recyclable system components: Matrix and Vaktis extended with specific functionality to KGK's unique needs.

Matrix gives high flexibility through its structure and possibility to publish information through several media. The component gives possibilities to build systems with powerful navigation by using links related to information. Different presentations of data can be connected to the structure.

Vaktis is a role based and distributed access control system. The principal purpose with the system is to handle the access control system of users in environment with a wide range of systems from different suppliers. This streamlines the development and facilitates administration of secure distributed applications. The usage of these system components gives a cost-effective system development and short delivery time.
