

Teligent receives order in Bulgaria

MobilTel orders advanced Content Mediation Platform

Teligent announces today further achievements in the Eastern European market with a new order from a new customer, the Bulgarian mobile operator MobilTel. The order, received in the fourth quarter of 2003, of an advanced Content Mediation Platform will be delivered within the second quarter of 2004.

A Content Mediation Platform is an access gateway for content providers to the mobile network. The ordered solution will handle data, such as MMS and SMS, as well as voice content services. This is of great interest to mobile operators since content services can provide both traffic and additional revenues, but there are also challenges to be met by the operators for an efficient interface to content providers. The need to manage hundreds or maybe thousands of content providers as well as the operator's fear that these external non-telecom partners may cause network and load problems are parts of the motive for the investment. The Teligent Content Mediation Platform acts as a gateway and broker between the external content providers and the operator's network, providing tools for e.g. surveillance, spam filtering, revenue sharing and service level agreements.

- Without a doubt, it is important for us to simplify the process for more and more external content within our network, says Nikolay Nikolov, Executive Director of MobilTel EAD. Various data and voice driven content services are becoming increasingly important and the co-operation with Teligent is one part in our effort to maintain our leading position on the Bulgarian telecom market.

For Teligent the order is valuable both since MobilTel is a leading operator in an expanding market and also since the area of content and service gateways is of increasing interest among mobile operators.

- The Teligent Content Mediation Platform is a flexible and competent enabler for opening up the network for various data and voice content. This is of increasing interest today and a challenge to be met by the industry, not least within 2.5G and 3G environments to ensure increased revenues from content services to complement basic voice call services, says Ulf Lindstén, CEO & President of Teligent. We are also proud of the order and to be able to continue our work in the expanding Eastern European market after our successful collaboration with Connex in Romania.

The ordered solution are based on the Teligent P90/E middleware platform, which is implemented in various configurations by a large number of leading carriers in the international telecommunications market, including AT&T Wireless, BT, Telefónica, Telia, Tele2 and members of the Vodafone group.
