Integrated WAP technology adds further strength to Intentia's e-business offering

Intentia's Enterprise Application Movex to offer customers WAP support

Following on Intentia's recent launch of the Web Explorer thin client user interface, Intentia today unveils the next step in mobile enterprise application access. By using the WAP technology (Wireless Application Protocol) as defined by the WAP Forum, Movex customers can use any WAP-enabled device, such as handheld computers and mobile phones to access their ERP system. This further extends the reach of the enterprise application to sales- and service staff and will also enable field equipment like vending machines to manage themselves and place orders straight into the Movex system.

The Intentia industry application Service and Rental will be one of the first to utilize the WAP support. Says Robert Lunnbäck, director Service and Rental, "this is perfect for the rental companies who can use mobile devices to directly communicate status, service requirements, lease extensions and other vital information in real-time with their enterprise application."

The Wireless Application Protocol is complementing or replacing the current SMS (Short Message Service) that are being used by many applications today for the distribution of information such as stock market movements and work orders. With WAP support, portable devices can start making use of the enterprise application's full capacity.

"This is the first step in a new and mobile era for the enterprise applications. Business opportunities are moving faster all the time and it is vital to provide customers with real-time, work anywhere, anytime, anyway technology. With the WAP support, Intentia delivers on the promise of a smooth ride into the future," says Johan Berg, Managing Director, Intentia R&D. "Integrating WAP technology into our enterprise application Movex is a yet another step in our efforts to offer the customers seamless e-business solutions."
