

PRESS RELEASE FEBRUARY 2, 2011

MOBERG DERMA REPORTS POSITIVE CLINICAL RESULTS FOR EMTRIX

Moberg Derma AB today reports positive results from a clinical trial of Emtrix. The trial included 75 patients with nail fungus (onychomycosis) and the results showed that 92% of the patients improved after 8 weeks of treatment. Already after 2 weeks, 77% of the patients were improved.

The open clinical trial was conducted at two clinical centers in Sweden during the second half of 2010. The purpose was to investigate early treatment effects of Emtrix. The patients were followed-up after 2, 4 and 8 weeks treatment with Emtrix.

"The rapid visible improvement of the nail is increasing patients' motivation to continue treatment until complete cure and the outgrowth of a clear nail. The results from this clinical trial provide additional support for upcoming launches in new markets", comments Moberg Derma's CEO, Peter Wolpert.

About Emtrix® and nail diseases

Emtrix® is a prescription free, topical nail product and has the potential to become first-line treatment for common nail disorders. Launch of Emtrix® was initiated in the first markets in September 2010. Safety and efficacy has been demonstrated in several clinical studies including more than 500 patients. Emtrix® has a unique and rapid mechanism of action which brings visible improvements after two weeks of treatment.

Nail fungus is the most common nail disease and afflicts approximately 10% of the general population and is more common in the elderly. The estimated global market potential exceeds USD 1 billion. The untapped potential is significant since many patients remain untreated. It is generally recognized that there is a need for new efficacious and safe topical treatments.
