

## Teleca's Obigo Browser displays prestigious Acid2 test page faultlessly

**Obigo Browser displays the Acid2 test page for web browsers correctly. Acid2 is an advanced test page published by the Web Standards Project (WaSP), whose objective is to ensure simple and affordable access to web technologies. The successful test is an example of how Obigo's technological lead makes advanced technology easy for mobile phone manufacturers and web designers.**

When displayed correctly the Acid2 test page shows a smiling face and the text "Hello world!" At first glance this might not seem like much, but it is in fact no mean feat because to do this Acid2 not only uses transparent PNGs, absolute, relative and fixed positioning, the CSS box model and tables, but also much more. In short, the page is a very advanced technical test.

Joakim Nydemark, head of Obigo, says: "It's a great honour to be one of the first mobile browser manufacturers to display the Acid2 web page correctly. We're proud of our cutting-edge technology that provides customers and end users with such highly advanced web page presentation."

Earlier this year, Safari became the first personal computer browser to display the Acid2 test page correctly, and since then the race has been on for mobile browser manufacturers. By displaying the Acid2 test page correctly, Teleca has secured its position as a leading supplier of advanced, high-quality mobile browsers that can display any internet site. The new version of Obigo Browser that passes the Acid2 test will reach the market at the next product release.

A film of Obigo Browser displaying Acid2 is available at [www.obigo.com](http://www.obigo.com), and the Acid2 test page is available at [www.webstandards.org/acid2/](http://www.webstandards.org/acid2/).
