

Substantial order in Southeast Asia

Continued success for Teligent in the region

Teligent announces details today of a substantial order from a leading communications group in Southeast Asia. The order entails the delivery of base installations of the generic multi-application platform Teligent P90/E, together with a company-wide network usage license. The unnamed communications group has thereby acquired the right to utilise the Teligent P90/E concept in order to build a new service network architecture which will accelerate future service developments.

The Teligent P90/E platform concept with its graphical service creation environment, the Teligent Application Builder, allows the operator to easily develop and modify service offerings as well as prototype new services within short lead times internally. This concept moves the service development closer to the market demands and the end-users, which allows faster implementation and quicker reaction to market demands.

During 2004 Teligent achieved a major breakthrough in the Southeast Asian market and signed agreements with some of the major carriers in the region; i.e. Telekom Malaysia and SingTel.

“We are delighted and honoured to team up with yet another merited communications group in this region. They are on the leading edge globally with regard to service deployments and I think this operator and Teligent’s platform technology form a perfect match” says Mikael Jigmo, President Asia Pacific.

“The fact that they invest in our core architecture and patented middleware platform with a network usage license is a true milestone which will make a difference for Teligent as a company and for our development in the region” says Ulf Lindstén, CEO of Teligent. “The order released today is already of a substantial size and my judgement is that this co-operation has all the possibilities to develop into one of the single largest relationships in the history of Teligent.”

The patented middleware platform, Teligent P90/E, separates network signalling, service execution and presentation to end-users. It is implemented in various configurations by a large number of leading carriers in the international telecommunications market, including BT, MCI, Telefónica, Telia, Tele2 and the Vodafone group.
