TietoEnator provides toolbox for WAP application development

An increasing number of companies are relocating their existing services to mobile networks and developing new types of services that make use of the potential offered by wireless terminals. TietoEnator has developed a WAPToolbox that speeds up and facilitates WAP application development and offers runtime services for the application. The WAPToolbox is one of the first products in the world designed to improve efficiency in WAP application development.

Developing mobile solutions in close co-operation with customers is one of TietoEnator's core businesses. TietoEnator has been a pioneer in providing wireless solutions particularly in the field of banking and telecommunications. The new WAPToolbox from TietoEnator offers considerable savings in time and costs in WAP application development.

TietoEnator uses the WAPToolbox extensively in its own application development and is now offering it to client companies for use as a programming tool. The WAPToolbox features all the tools and user interfaces required for developing complex applications for the WAP platform, without the need for an in-depth knowledge of the WML syntax. This is possible because the toolbox automatically generates the WML code.

With the WAPToolbox, the user can concentrate on the application's logic without having to worry about how the terminal equipment and gateways operate. In addition, it is very easy to maintain and refine the applications. With the Toolbox, it is also possible to distribute the applications across several servers and to implement multi-language application services.

The WAPToolbox is suitable for all businesses that develop services for the WAP platform, such as telecom operators, banks, and media companies. Implemented with Java, the WAPToolbox runs under Windows NT, Unix and Linux and its operation has been tested on various types of terminal equipment.
