Ortivus North America launch new software product, Fusion ePCR

At the conference **EMS Today** in Baltimore, USA, (during the weekend) Ortivus North America presented officially for the first time its new product Fusion ePCR. Fusion ePCR represents the first product launched on the new platform that has been in development within the North American company for some time. Fusion ePCR is a documentation and reporting tool for EMS, and addresses old as well as new customers on the local market.

Fusion ePCR provides patient caregivers with means to facilitate an efficient data collection process to quickly produce accurate and complete electronic patient care reports. Fusion ePCR provides features such as touch screen navigation, ability to attach photos/documents to a report, a configurable layout, integrated decision support logic, customizable documents and an encrypted patient database.

The flexible system configuration and user interface enables users to work within a comfortable environment, customized for their needs. These features increase the speed of data entry, as well as the speed of adoption by users.

Fusion ePCR is fully integrated with Ortivus North Americas number one EMS Billing application, Sweet-Billing. Together the products reduce the time between patient transport and claim submission. Deliveries of the new product to end customers will start later this year.

"Through the introduction of Fusion ePCR Ortivus will strengthen its already strong position on the North American EMS market further. It also represents the first result from our new North American software platform", says Jan B. Andersson, CEO Ortivus AB.
