

Atlantis™ – patient-specific CAD/CAM abutments now available for screw-retained restorations

Möln dal, Sweden, October 13, 2011 – Astra Tech Dental, leader and provider of comprehensive solutions for implant dentistry, is pleased to announce the introduction of Atlantis™ crown abutment for single-tooth screw-retained restorations.

The introduction of Atlantis crown abutment will be an important and welcomed addition to dentists preferring screw-retained prosthetic solutions. The Atlantis crown abutment is uniquely designed from the final tooth shape for a more natural esthetic final result for the individual implant patients. The abutment is available in five shades of biocompatible zirconia, including the new translucent white zirconia exclusively available for this product.

For the laboratories this introduction streamlines the internal procedures, providing an efficient and cost effective solution by eliminating time spent on modification, casting and the expense of using precious metals.

Astra Tech Dental is committed to providing customers with solutions and services that bring them increased simplicity and efficiency in achieving optimized, patient-specific solutions. Atlantis crown abutment is another step in that direction.

Atlantis™ patient-specific abutments

Atlantis™ is the original and best solution for cement-retained and screw-retained implant prosthetics. The patient-specific abutments are designed and fabricated using Atlantis VAD™ (Virtual Abutment Design) software, a patented process that combines state-of-the-art 3D optical scanning, advanced software and manufacturing methods to deliver patient-specific abutments that eliminates the need for hand modification.

Atlantis patient-specific abutments are available for all major implant systems and in biocompatible materials such as titanium, gold-shaded titanium and different shades of zirconia, including translucent white for the Atlantis™ crown abutment.

About Astra Tech
